

Think Pipeline Integrity

We all know that pipeline integrity requires thinking ahead. Enduro can help with our complete Pipeline Integrity Service utilizing our DfL™ multi tool's ability to acquire data from several sources *at one time in one pass*, allowing our analysts to compare/analyze each data set. The result, to more readily recognize all pipeline features, geometry and/or metal loss indications plus simultaneously evaluate for deformation, strain, profile and permeability variations. Enduro's single pivot sensors have the ability to record very small Deformation and Metal Loss with one tool and confirm these indications with our single analysis PigProg2™ software program.
